See STARK.] **1.** A white, odorless, tasteless, granular or powdery carbohydrate, $(C_6H_{10}O_5)_x$, widely disseminated among plants, esp. in seeds, bulbs, and tubers. It is a most important element of food, and is used in making commercial glucose, for stiffening linen, in making paste, etc. It is formed in the plant by photosynthetic activity (see PHOTOSYNTHESIS) and is always to be found as minute grains in the chloroplasts when the plant is exposed to light. It is

deposited by the leucoplasts in large granules of organized structure, which serve as reserve food. In the United States, maize is the chief commercial source; in Europe, the potato. It is insoluble in cold water, but when heated with water the granules burst and a viscous liquid is formed which becomes a paste on cooling. By continued boiling a modification known as **soluble starch** is formed. Starch is converted into dextrin by heating, and into dextrin, maltose, and finally glucose, by heating with dilute acids. Diastase converts it into dextrin and maltose, with formation of intermediate products. According to the so-called **amylon theory**, the starch molecule consists of five *amylin* groups, each having the formula $(C_{10}H_{20}O_{10})_{20}$. Of these four are, by the action of diastase, successively split off, and by further hydrolysis converted into *amyloins*, while the fifth remains, forming what is called **stable dextrin**. The amyloins, of which *amylodextrin*, $C_{12}H_{22}O_{11}$ $(C_{12}H_{20}O_{10})_6$, and *maltodextrin*, $C_{12}H_{22}O_{11}(C_{12}H_{20}O_{10})_{12}$, are examples, are products representing various intermediate stages between amylin and maltose, and are finally converted entirely into maltose.

Cf. EDICT, 1; DECREE, 4; ORDINANCE, 3 **d**; CONSTITUTION, 6, etc. In works on international law and in the Roman law, *statute* is sometimes used as embracing all laws imposed by competent authority, these being divided into **statutes real,** applying to immovables; **statutes personal,** to movables; and **statutes mixed,** to both classes of property. In England Parliament may give its acts full force and validity as statutes without the assent of the crown, though in practice all statutes are promulgated by the crown; but in republican forms of government the acts of the legislature generally require the assent of the chief executive, as the President, in the United States, for a Federal statute, or the governor of a State for a State statute (cf. VETO). At the common law a statute took effect by relation back to the first day of the session at which it was enacted, but the act of 33 Geo. III. c. 13 provided that acts should, unless otherwise provided, take effect from the date of the royal assent. In the United States, generally, an act takes effect from the date of the final act necessary to its enactment, unless, as is usual, the statute itself fixes the time of its taking effect. Cf. EXPOST FACTO LAW. Formerly in England all statutes were originated by a petition presenting measures to the king for his granting. Now, except private bills in English law, statutes are originally expressed, both in English and American law, in the form of a bill which is presented to the legislature for enactment and passed for the assent of the king or executive. **b** An act of a corporation or of its founder intended as a permanent rule or law; as, the *statutes* of a university.

I. c. 1 (1285), often called *Statute of Westminster II.*, procured to be passed by the nobility to put an end to the construction of conditional fees which enabled the donee of the fee (by aliening upon performance of the condition) to defeat the limitation. The statute provided that the will of the donor should be observed according to the form of the gift, taking away the power of absolute alienation, and providing that upon failure of the issue of whom the estate was limited the estate should revert to the donor or his heirs. This resulted in the modern fee tail, and the great estates built up by it. — **Stat'ute de Re-li'gi-o'sis** (dē rē-lĭj'ĭ-ō'sĭs). See STATUTE OF MORTMAIN. — **s. of Additions.** *Law.* See ADDITION, 6, *Cit.* — **s. of armor** *or* **armour,** any of several English statutes, esp. the Assize of Arms (which see), relating to the carrying or having of arms. — **S. of Bread and Ale.** = ASSIZE OF BREAD AND ALE (see ASSIZE, 2). — **S. of distribution,** a statute regulating the distribution of decedent estates. — **s. of entail.** = STATUTE DE DONIS. — **s. of frauds** [*often cap., in specific use*], *Law,* the English statute 29 Car. II. c. 3 (1676), the purpose of which is expressed to be to prevent "many fraudulent practices which are commonly endeavored to be upheld by perjury and subornation of perjury." It aims to do this by requiring proof of a specific kind, usually in writing, of the more important transactions of business, declaring that "no action shall be brought" or "no contract shall be allowed to be good" when the transaction is not so evidenced. In the United States each State has a statute of frauds, most of the provisions of the original act being therein reënacted. In some States contracts not evidenced as required by the State statute are declared "void" or "invalid." — **S. of Glouces'ter** (glŏs'tẽr). See EDWARDIAN, *a.* — **S. of Laborers** *or* **Labourers,** *Eng. Law,* the act 25 Edw. III. c. 1 (1351), which (succeeding the Black Death) enacted that laborers and servants should accept the same wages as prevailed in 1345, before the plague. — **s. of limitations,** *Law,* a statute assigning a certain time after which rights cannot be enforced by action. See LIMITATION, *n.*, 5 *c.* — **S. of Marl'bo-rough** (mârl'bō-rŭ; môl'brŭ), *or, formerly,* **Marl'bridge,** *Eng. Hist.*, a reënactment by the Parliament of Marlborough, in 1267, of the Provisions of Oxford and most of certain provisions made at Westminster and assented to by the king in 1259. Slight changes were made, including the giving to the king of the power of appointing the ministers of the crown and the sheriffs. — **S. of Merchants,** an ordinance (13 Edw. I. c. 6) of the Curia Regis at Acton Burnell (whence it is also called **Statute Actonburnell** [ăk'tŭn bûr'nĕl]) in 1283, designed for the better securing and recovery of debts, which it provided might be evidenced by a specially acknowledged bond (which came to be called a **statute merchant**) of record in form prescribed, on which, if not paid at the day, an execution might be awarded against the body, lands, and goods of the debtor. This ordinance of 1283 was reënacted in a fuller and slightly modified form by 15 Edw. I. c. 6 (1285), which is also called **Statute of Merchants.** These statutes were repealed by the Statute Law Revision Act of 1863. — **S. of Mer'ton** (mûr'tŭn), *Eng. Law,* a statute, or body of provisions, passed in an assembly of the Barons held at Merton in Surrey and issued as law by Henry III. in 1236. It amends the law about various miscellaneous matters, including conflicting rights of the lords and their tenants to make profit of lands, wastes, woods, and pastures. It was supplemented by the Statute of Westminster II. — **S. of Monopolies,** the act of 21 Jas. I. c. 3, declaring monopolies to be contrary to the law of England and aiming to suppress them, with certain exceptions, as the monopoly allowed to inventors, made on grounds of public policy. — **s. of mortmain,** any of various English statutes restricting alienation of land in mortmain, that is, to a corporation, orig. an ecclesiastical corporation, such as the **Stat'ute de Re-li'gi-o'sis** (dē rē-lĭj'ĭ-ō'sĭs) (7 Edw. I., 1279), which forbade all alienations in mortmain, the act of 13 Edw. I. c. 32 (1285), forbidding such alienation by common recovery (which had been used to evade the prior one), the act of 15 Rich. II. c. 5 (1391), forbidding alienation to the use of an ecclesiastical corporation except under the royal license, the act of 9 Geo. II. c. 36 (1736), declaring wills for charitable purposes void except under certain conditions, and various other statutes of later years. The main original purpose of these statutes was to preserve to the lords the feudal rights of relief, wardship, marriage, and escheat, which conveyance in mortmain took away; that of the later statutes is to prevent undue accumulation of wealth in the hands of corporations. All the mortmain acts were repealed by the Mortmain and Charitable Uses Act of 51 & 52 Vict. c. 42 (1888), which consolidates the provisions of, and repeals, the earlier acts. — **S. of Præmunire.** See PRÆMUNIRE. — **S. of Provisors,** *Eng. Hist.*, the statute of 25 Edw. III. s. 4 (1351), designed to prevent the Pope from exercising the right of provision and reservation of, or presenting to, benefices in England. This and reënactments of it in 1362 and 1390 (called also **Statutes of Provisors**) were largely in obeyance till the reformation in the reign of Henry VIII. — **S. of Qui'a Emp-to'res** (kwī'ă ĕmp-tō'rēz) *or* **Qui'a Emp-to'res Ter-ra'rum** [L. *quia emptores (terrarum)*, lit., because purchasers (of lands)], *Eng. Law,* a statute (18 Edw. I., 1290) which, referring to tenants not in chief, declared that every free man might sell his tenement or any part of it, but that the feoffee should hold of the same lord and by the same services of whom and by which the feoffor held. The effect of the statute was to abolish subinfeudation. — **S. of Staple.** See STATUTE STAPLE. — **S. of Treasons,** *Eng. Hist.*, the statute 25 Edw. III. st. 5, c. 2 (1351), defining the acts constituting treason. — **S. of Uses.** See USE, *n.* — **S. of Wales,** the statute of 12 Edw. I. (1284) annexing Wales to the dominion of the crown of England. — **S. of Westminster,** either of three early English statutes made at Westminster in 1275

steam engine. An engine driven or worked by steam; often, specif., a locomotive. Certain crude steam engines are described by Hero of Alexandria (2d century B. C.). The first commercially successful steam engine, that of Thomas Savery, dates only from 1698. This water-pumping engine, with hand-worked valves, operated much like the pulsometer. It was an **atmospheric engine**, or one in which the steam was used to obtain by condensation a partial vacuum, into which the atmospheric pressure pushed the water up through a suction pipe. This water was displaced by steam, and the operation repeated. Newcomen (about 1711) and others improved on this by introducing a solid piston to separate the water and steam, and subsequently by making the machine automatic. The next improvements of note were by James Watt, who in his patent of 1769 declared that: (1) The cylinder must be kept as hot as the steam that enters it (see CYLINDER CONDENSATION); (2) the steam from the cylinder must be condensed in a separate vessel (the condenser), which must be kept clear of air and water by a pump; (3) the expansive force of the steam must be utilized (see EXPANSION, 7). Watt's principles practically govern present steam-engine practice. His first engine was a **single-acting** beam pumping engine. He later invented the **double-acting** engine and effected many other improvements, and his assistant Murdoch introduced the slide valve. The common **reciprocating steam engine** of to-day consists essentially of a piston driven in a closed cylinder by steam at a pressure initially much greater than that of the atmosphere. The piston is connected rigidly by a piston rod to a crosshead (except in the trunk engine), the reciprocating motion of which is usually converted into rotary motion by a connecting rod, crank pin, crank, and crank shaft. The steam distribution is effected by a slide valve or other automatic valve or valves, and is usually regulated by a link motion or some other form of valve gear. In the **rotary engine**, a piston, vane, or the like, is constrained to move in a circular path, thus obviating the necessity for a connecting rod and a crank. See also CENTRAL-VALVE ENGINE, ROTATIVE ENGINE, TURBINE, etc.

Steam engines are broadly classified as: **condensing engines**, in which the steam, after exhausting from the cylinder, is condensed in a separate coudenser (see CONDENSER, 2 **e**), thus largely obviating back pressure due to atmospheric pressure, and, incidentally, saving most of the water; **non-condensing engines**, in which the steam is exhausted directly into the air. For further classification see ENGINE, *n.*, 4. Cf. INTERNAL-COMBUSTION ENGINE.

Syn. — SUAVE, BLAND, OILY, UNCTUOUS, FULSOME, SMUG. SUAVE implies an affable or urbanely persuasive manner ; BLAND suggests gently soothing or coaxing qualities ; as, *suave* and ingratiating manners, the *suavity* of a diplomat ; "the *bland*, emollient, saponaceous qualities both of sack and silver" (*Gray*) ; "His manners were gentle, complying, and *bland*" (*Goldsmith*) ; "Mr. Pickwick was . . . producing a constant succession of the *blandest* and most benevolent smiles" (*Dickens*). OILY and UNCTUOUS both suggest fawning, suppleness, or hypocrisy ; FULSOME applies esp. to praise, flattery, etc., which is gross or cloying ; as, "rills of *oily* eloquence" (*Cowper*) ; "a man of hard temper and *oily* manners" (*Trollope*) ; "Off at Bible meetings . . . he did his holy *oily* best" (*Tennyson*) ; "The look [of benevolence] was, perhaps, *unctuous*, rather than spiritual, and had, so to speak, a kind of fleshly effulgence. . . . He . . . smiled with more *unctuous* benignity than ever" (*Hawthorne*) ; cf. "that kind of *unction* which is nearly [allied] to cajolery" (*Scott*) ; "He was bedabbing one of those worthies with the most *fulsome* praise" (*Smollett*). SMUG, as here compared, implies bland or unctuous self-complacency ; as, "It is edifying to behold him, fresh shaved and with a *smug* face, singing out : Amen ! at early chapel" (*Thackeray*) ; "the *smug* conviction which every man seems to cherish that he is in the secret" (*T. E. Brown*). See CIVIL, SMOOTH, FAWN, INGRATIATE.

sub- (sŭb-) ; *many compounds of sub-, esp nouns, have variable accent, dependent upon position and emphasis : see Guide to Pron.*, § 87). [L. *sub* under, below ; akin to Gr. *ὑπό*, Skr. *upa* to, on, under, over. The *s* perh. represents a prefixed *ex.* The original sense was perh., from under up to. Cf. HYPO-, SUPER-.] A prefix signifying, in general, *under, below, beneath.* Hence, specif.: **1.** a In many words, mostly of Latin origin, *sub-* has the sense of *under, beneath, below, down ;* as in *subscribe,* to write under ; *submerge,* to plunge down ; *subbronchial, sublingual.* Cf. INFRA-, INFERO-. **b** In many English formations, esp. in terms in biology, medicine, etc., and in a few words of Latin origin, *sub-* expresses *in an inferior degree, an imperfect* or *partial state, somewhat, slightly, less than usual or normal, almost, nearly ;* as in *subacid,* slightly acid ; *subglobular,* almost globular ; *subovate, subrigid, subsessile, suborbicular.* **c** In nouns denoting rank, title, position, occupation, classification, etc., *sub* indicates a rank, title, or position, or the like, *next lower than, subordinate to,* or *inferior to,* that denoted by the subjoined word ; as in *sublieutenant, subdeacon, subgenus, subfreshman, subspecies.* Hence *sub-* in various words implies an idea of *repetition,* so as to form subordinate parts or features, as in *subclassify, subdiversify,* etc. **d** In numerous words from the Latin the force of *sub-* is obscure, and often quite unfelt in English by those unfamiliar with Latin. *Subjunctive, subtend, suffrage, suggest, suppress,* are familiar examples.

2. *Chem.* A prefix denoting that the ingredient (of a compound) signified by the term to which it is prefixed is present in *only a small proportion,* or *less than the normal amount ;* as, *subiodide, subsulphide, suboxide,* etc. Prefixed to the name of a salt it is equivalent to *basic ;* as, *subacetate,* or *basic* acetate.

3. *Math.* A prefix to adjectives modifying *ratio,* indicating the *inverse of the ratio ; as subduple, subduplicate,* etc. ; *subtriplicate* ratio is the inverse ratio of the cubes.

☞ *Sub-* in Latin compounds often becomes *sum-* before *m, sur-* before *r,* and regularly becomes *suc-, suf-, sug-,* and *sup-* before *c, f, g,* and *p,* respectively. Before *c, p,* and *t* it sometimes takes the form *sus-* by the dropping of *b* from a collateral form, *subs-.* Nearly all of the words showing these variant forms of *sub-* are to be classed under 1 **d**.

☞ The reference "See SUB-" is sometimes given as the only definition of a word beginning in *sub-,* if its meaning can readily be gathered from the definitions of the prefix and the root word.

Syn. — Subordinate, inferior; liable, obnoxious, exposed. — SUBJECT, INCIDENT are sometimes confused in their use. But the terms are really correlative, — *incident* being active and *subject* passive. INCIDENT applies to that to which anything is liable or exposed; SUBJECT applies to that which is liable or exposed to something. Thus, change is *incident* to life; life is *subject* to change; "Most *subject* is the fattest soil to weeds" (*Shak.*); "a malady most *incident* to maids" (*id.*). See APT.

sub'ject, *n.* [Ultimately fr. L. *subjectus*, prop., p. p. In some senses, as 4, 5, 6, fr. L. *subjectum* that which is spoken of, the foundation or subject of a proposition, prop. neut. p. p.; perh. through F.; cf. F. *sujet*. See SUBJECT, *a.*]

1. One that is placed under the authority, dominion, control, or influence of something else.

2. Specif., one who is subject to a monarch or ruler and is governed by his law; in a wider sense, one who lives in the territory of, and enjoys the protection of, and owes allegiance to, a sovereign power or state. Primarily and accurately speaking *subject* is used only to denote one who by birth, or now by naturalization, owes allegiance to a monarch or conquering state; but the term is loosely used, esp. in international law, to designate also a citizen (which see) of any other form of sovereign state, as of the United States, and even, in a still wider sense, a citizen of a commonwealth constituting a member of a sovereign state. See CITIZEN, 3; ALLEGIANCE, 2.

It is interesting to notice how the need of some word to express colonial citizenship has evolved the phrase "*subject* of a colony," first made use of by Sir G. J. Turner, L. J., in Low *v.* Routledge, L. R. 1 Ch. 42, 1865. *Quick & Garran.*

3. One that is subjected, or submitted, to any physical operation or process; one that is liable or exposed (to something); specif., *Anat.*, a dead body for dissection.

4. That concerning which anything is said or done; the thing or person treated of; matter; theme; topic. "This *subject* for heroic song." *Milton.*

5. *Gram.* The word or word group denoting that of which anything is affirmed or predicated; the word or words, with or without modifiers, construed as the nominative of a verb. The subject of a sentence is either a noun or a word, phrase, or clause used as a noun equivalent. A *grammatical* or *formal subject*, as being the subject only in the form of sentence construction, is sometimes distinguished from the *logical subject*, the real subject of predication. Thus in, it is hard to do right, *it* is the grammatical, and *to do right* is the logical, subject. A subject may be *compound*; as in, the *winds and waves* obey him.

6. *Logic.* That part or term of a proposition indicating what the proposition signifies or characterizes; also, that of which a proposition is a characterization or designation; the idea or thing about which a judgment is made.

In affirmation at any rate, if not in negation, we commonly regard the *subject* as a thing, or class of things, endowed with miscellaneous and indefinitely numerous attributes, the function of the predicate being to modify the *subject* by adding on one or more fresh attributes. *John Venn.*

7. *Philos.* **a** That of which a quality, attribute, or relation may be affirmed or in which it may inhere; the theme of a discourse or predication, the identical reference of related thoughts, or a material, be it physical or ideal, in which differences may appear.

That which manifests its qualities . . . — that in which the appearing causes inhere, that to which they belong — is called their *subject* or substance, or substratum. *Sir W. Hamilton.*

b Hence, substance; substratum; esp., substantive reality; the real, conceived as material or essential being. **c** That which sustains or is embodied in thought or consciousness; the thinking agent; the mind, ego, or reality of whatever sort, which supports, or assumes the form of, mental operations. See OBJECT, *n.*, 4.

Augustine intended the "Quod si fallor, sum," to be merely an indirect refutation of the principles of the Academy, and not a direct demonstration of the existence of the thinking *subject*. *Wm. Turner.*

The individuality of the organism corresponds to, though it is not necessarily identical with, the psychological *subject*, while to the environment and its changes corresponds the objective continuum or totum objectivum already described. *James Ward* (*Encyc. Brit.*).

The philosophers of mind have, in a manner, usurped and appropriated this expression to themselves. Accordingly, in their hands, the phrases *conscious* or *thinking subject*, and *subject*, mean precisely the same thing. *Sir W. Hamilton.*

8. *Music.* The principal theme, or melodic phrase, on which a composition or a movement is based; the antecedent, dux, etc., of a contrapuntal work, as a fugue or canon.

2. To bring under control or dominion; to subdue.

Firmness of mind that *subjects* every gratification of sense to the rule of right reason. *C. Middleton.*

3. To expose; to make liable; — with *to*; as, credulity *subjects* a person to impositions.

4. To submit; to make accountable; — with *to*.

God is not bound to *subject* his ways of operation to the scrutiny of our thoughts. *Locke.*

5. To make subservient; — with *to*. *Rare.* *Milton.*

6. To cause to undergo; to submit (a thing or person) to the action or effect (of something); to expose; — with *to*; as, to *subject* a substance to heat or a person to a test.

3. *Philos.* **a** Pert. to the real or essential being of that which supports qualities, attributes, or relations; substantial; real; objective (in the modern sense. See OBJECTIVE, 2 **b**). **b** Of, pert. to, or derived from, the ego, mind, or consciousness, or mental operation as contrasted with external qualities and forces; in a restricted sense, of the nature of mind apart from external realities; purely psychical.

☞ The modern meanings of *subjective* (**b** above) and *objective* are mainly derived from the Kantian conception of the *subject of experience* as the necessary condition of reality. These meanings are the opposite of the older, medieval conceptions (see **a**, above, and OBJECTIVE, 2 **a**).

In the philosophy of the mind, *subjective* denotes what is to be referred to the thinking subject, the ego; objective, what belongs to the object of thought, the nonego. *Sir W. Hamilton.*

At the outset, *subjective* and objective express plainly enough a relation between the act of perception and the object perceived. But soon some one understands by it the position of the single individual in relation to the entire mass of persons judging; and then the relation of the specifically human view of the world to the real nature of things; and, finally, the relation of thought to being in general. *R. Eucken (Phelps).*

Mind is sometimes used as coextensive with an inner sphere of experience in its entirety, as in empirical psychology, for instance; at other times it is restricted to the subject that has the experience. So, in like manner, *subjective* refers at one time exclusively to this subject, at others is made to cover both the subject and the totality of its objects as such. *James Ward.*

Hence, arising from, concerned with, or belonging to, the individual mind; specif.: **a** Fanciful; illusory; as, *subjective* appearances. **b** Excessively or moodily introspective; given to brooding over one's mental states; as, a *subjective* life. **c** *Lit. & Art.* Modified by, or making prominent, the individuality of a writer or an artist; as, a *subjective* painting or writer.

sub-lime', *n.* That which is sublime, or the quality of sublimity; — usually with *the*. Some æstheticians have identified *the sublime* as a type of the beautiful, and some have distinguished it from beauty; but all are agreed that it is that which arouses sentiments of awe and reverence and a sense of vastness and power outreaching human comprehension. Although the element of magnitude enters into both, sublimity excels *grandeur* in its immeasurability and its suggestion of indefinite power. "Hegel described Hebrew poetry as *sublime*, and distinguishes it from the beautiful in the fact that it makes the images borrowed from nature offer a contrast to the actions of the Creator. What is great and mighty to our human observation is quite insignificant when viewed in the purposes of Jehovah. With a mere word He creates light, the sun, the moon; He looks on the hills and they smoke; the heavens declare His glory; the Creator finds only inadequate expression in nature. But in Greek art the form is equal to the content, and this is the beautiful." *W. T. Harris.*

sub'si-dy (sŭb'sĭ-dĭ), *n. ; pl.* -DIES (-dĭz). [L. *subsidium* the troops stationed in reserve in the third line of battle, reserve, support, help, fr. *subsidere* to sit down, lie in wait : cf. F. *subside*. See SUBSIDE.] **1.** Formerly, in England, a sum of money granted by Parliament to the crown and raised by extraordinary or special taxation, in distinction from the proceeds of the customs or other taxes levied by royal prerogative. Subsidies came to be granted annually or for fixed periods, consisting either of the grant of a tax in excess of the ordinary customs or of a tax upon persons in respect of their estates at the rate of 4 shillings in the pound upon the yearly value of their land and of 2 shillings 8 pence in the pound upon the value of their goods, besides other minor sums, as that granted by the clergy. Subsidies were replaced during the Commonwealth with revenue raised by a land tax, and no subsidies were subsequently granted, except those to Charles II. before 1670.

2. **a** A sum of money granted by one state to another, as to a friendly power to aid in the prosecution of a war. **b** A grant of funds or property from a government, as of the state or a municipal corporation, to a private person or company to assist in the establishment or support of an enterprise deemed advantageous to the public ; a subvention. In practice subsidies are chiefly granted in aid of transportation enterprises, as to ship, canal, or railroad companies, bounties on sugar being next in importance. A subsidy may be a simple gift or may consist in the payment of an amount in excess of the usual charges for any service, as in carrying the mails, or of funds to aid in establishing or maintaining a service or equipment larger or more powerful than the state of trade would warrant, as the building and keeping in service of vessels designed for use as cruisers and auxiliaries in war. *Subsidy* is often inexactly used to designate an entire payment for services, as for carrying mail, which properly speaking includes compensation for actual services and a subsidy proper, consisting in the sum paid in excess of the compensation.

3. Any gift of money or property made by one person to another by way of financial aid.

Syn. — SUBSIDY, SUBVENTION, BOUNTY have various technical senses, for which see defs. In ordinary usage, SUBSIDY is the general term, and often carries a derogatory implication ; SUBVENTION applies esp. to grants for artistic, literary, or scientific, rather than commercial, purposes ; BOUNTY emphasizes the idea of a premium.

In metaphysics *substance* may denote: The *subject;* that which is, or of which something may be predicated. Substance in this sense is conceived as a real or ontological subject rather than a merely logical one. The *essence;* that which makes a thing what it is, or gives it its essential nature. Substance in this sense is always the essence of an existent thing; it is essence plus existence; a real or determinate subject. The *substrate;* that which supports attributes or modes, or exists as the material of individuation; matter. And he the *substance*, not the appearance, chose. *Dryden.*

St. Thomas, following Aristotle, distinguished the first *substance*, which is the individual, or hypostasis, and the second *substance*, which is the universal substantial nature abstracted from the individual. First *substance* really exists as such. Second *substance* does not exist as such, except in the mind. *Wm. Turner.*

Aristotle meant by it [*substance*] any distinct thing; e. g., I, you, an animal, a plant, the earth, the moon, the sun, God. He calls each of these, as existing apart, a thing per se (καθ' αὑτό). It is true that, having divided a natural *substance* into form and matter, he called each element "*substance*." *Thos. Case (Encyc. Brit.).*

☞ *Such* is often used emphatically without the correlative, noting the kind or quality (often understood) as extreme or of a high degree; as, *such* a boy! I shall have *such* a time! *Such* was formerly used like an adverb with numerals in the sense of *times as much* or *as many*; as, *such ten*, or ten times as many. The indefinite adjectives *some*, *several*, *one*, *few*, *many*, *all*, etc., precede *such*; as, one *such* book is enough; all *such* people ought to be avoided; few *such* ideas were then held.

"In *such and such* a place shall be my camp." 2 *Kings* vi. 8. "A law commanding *such or such* an action." *South.* — **s. like**, of the like kind; similar.
And many other *such like* things ye do. *Mark* vii. 8.

SACCHARINE, SUCROSE.] **1.** A sweet, crystallizable substance, colorless or white when pure, occurring in many plant juices, and forming an important article of human food; — called specif. *cane sugar,* and also *saccharose* and *sucrose.* The chief sources of sugar are the sugar cane and the sugar beet, the completely refined products of which are identical and form the loaf sugar, granulated sugar, etc., of commerce. The juice is treated with lime to remove impurities, filtered, and evaporated. The mother liquor, or molasses, is removed by draining or by a centrifugal. The crude yellowish or brown sugar thus obtained is usually refined by redissolving, clarifying, decolorizing, and recrystallizing. Crude cane sugar is often sold as *brown sugar,* but the crude beet sugar has an unpleasant flavor. Some sugar is also made from palm and maple trees, common sorghum, etc. Sugar dissolves in about half its weight of water and forms fine monoclinic crystals melting at 160° C. (320° F.). Chemically, it is a disaccharide of the formula $C_{12}H_{22}O_{11}$. It does not reduce Fehling's solution and does not ferment directly, but is converted by diastase (or by heating with acids) into the fermentable mixture called *invert sugar.* It is dextrorotatory, and this property is utilized in estimating the strength of its solutions. Sugar is a food, and also serves as a condiment and preservative for other foods. See FOOD, 1.

2. By extension, any of a class of sweet substances belonging to the carbohydrates, and regarded chemically as ketonic or aldehyde derivatives of higher alcohols. The sugars are classed as monosaccharides, disaccharides, and trisaccharides, and the first class is again subdivided into tetroses, pentoses, hexoses, etc. Some of the most important sugars are: CANE SUGAR (see def. 1), *glucose* or grape sugar, *fructose* or fruit sugar, *lactose* or milk sugar, and *maltose* or malt sugar. Sugar of some form appears to be the first carbohydrate formed by green plants through photosynthesis, and being readily soluble, is either translocated as a food material to the growing parts, or converted into starch and stored up for future use. **3.** Short for MAPLE SUGAR. *Local, U. S. & Canada.* **4.** Anything resembling sugar in taste or appearance. **5.** Compliment or flattery used to cover something obnoxious; honeyed or soothing words. *Obs. or Colloq.*

F. *soufre* whence ME. *soufre*.] **1.** *Chem.* A nonmetallic element occurring naturally in large quantities, either native or combined as in various sulphides (pyrites, galena, etc.) and sulphates (gypsum, barite, etc.). It is also a constituent of proteins and of some other substances found in animals and plants. Symbol, S; at. wt., 32.07. Native sulphur occurs in yellow orthorhombic crystals, in masses, crusts, and powder. H., 1.5–2.5. Sp. gr., 2.06 (when pure). It is found in volcanic regions, as in Sicily, mixed with gypsum and other minerals, in vast beds, also in nonvolcanic regions, as in Louisiana. It is melted out from accompanying earthy matter and purified by distillation. The first vapors are condensed as a lemon-yellow powder called *flowr*, or *flowers*, *of sulphur*; the remainder is condensed as a liquid which is cast into sticks, forming *roll sulphur* or *brimstone*. *Sulphur vivum* (vī'vŭm), or horse brimstone, is an impure grayish product formed from the dregs in casting. Sulphur is also recovered from waste, as by the Chance-Claus process. Sulphur exists in several physical states. Below 96° C., the familiar orthorhombic form is stable. From 96° to 119° the stable form is one forming pale monoclinic crystals (sp. gr., 1.96). From 119° to 160° sulphur is a pale yellow, mobile liquid. At 160° it becomes dark-colored and viscous and remains viscous up to 449.5°, the boiling point. An elastic form of sulphur is obtained by boiling commercial roll sulphur and pouring it into cold water. After a time this elastic sulphur becomes brittle, being changed into a mixture of orthorhombic sulphur and an insoluble, amorphous variety which is found also in flowers of sulphur. By acidifying a thiosulphate solution, sulphur is precipitated as a white powder. Sulphur burns in air with a blue flame, forming the suffocating gas sulphur dioxide. It is used in making gunpowder, matches, fireworks, sulphuric acid, carbon disulphide, etc., for vulcanizing rubber, for destroying fungi, for bleaching, and in medicine as a laxative, diaphoretic, and resolvent. Chemically, sulphur exhibits several valences (two, three, four, six, seven) and is acidic in all. It is the type of a group of elements, including selenium and tellurium, called collectively the **sulphur group** or family. In many respects sulphur resembles oxygen.
2. Any of numerous butterflies of the family Pieridæ, usually having the wings chiefly yellow or orange with a black border. **The clouded sulphur** (*Eurymus*, or *Colias*,

sulphuric acid. *Chem.* **a** Sulphur trioxide; — formerly so called on the dualistic theory of salts. *Obs.* **b** A heavy, corrosive, oily liquid, H_2SO_4, colorless when pure, early made by distilling green vitriol, whence the name *oil of vitriol*; also, a liquid consisting of this compound diluted with a varying amount of water. In the two main processes now in use for manufacturing sulphuric acid, sulphur dioxide (obtained by burning pyrites or sulphur) is made to combine with oxygen from the air. The chamber process accomplishes this in a series of lead chambers with the introduction of steam, and in presence of oxides of nitrogen, which are not consumed, but are subject to a certain amount of mechanical loss, greatly lessened by the Gay-Lussac and Glover towers. The chamber acid thus produced has a strength of 70 per cent or less, which by passage through the Glover tower, or heating in lead pans, may be raised to about 80 per cent. To produce the commercial oil of vitriol (91–97 per cent) recourse is had to evaporation in glass or platinum vessels. The contact process, based on the catalytic action of finely divided platinum, is conducted by passing the well-dried and purified burner gases through the contact apparatus (which contains the platinum or platinized asbestos, and which can be kept at a temperature of about 350° C. or 662° F.), and absorbing the sulphur trioxide, formed by the direct union of sulphur dioxide and oxygen, in water. Pure acid is thus made without further manipulation. Concentrated sulphuric acid has a sp. gr. of 1.84. It combines readily with water, developing great heat when mixed with it, and corroding and charring organic substances by extracting it. For this reason the acid often becomes gray or brown colored from contact with dust, etc. Fuming sulphuric acid (or Nordhausen acid) is made by dissolving sulphur trioxide in concentrated sulphuric acid. It has a sp. gr. of 1.85–1.90 and is more energetic in its action than the ordinary acid (cf. DISULPHURIC). The so-called solid, or solidified, sulphuric acid is made by saturating some inert solid, as kieselguhr, with the concentrated acid. Sulphuric acid is of great importance in very many processes in arts, trades, and sciences. Chemically, sulphuric acid is dibasic, not dissociating so easily as hydrochloric and nitric acids, but able, by reason of its higher boiling point, to expel these and many other acids from their salts. It forms well-defined hydrates which are named as hydrates of sulphur trioxide. Thus, H_2SO_4 is called *monohydrated sulphuric acid*; H_4SO_5, *dihydrated*, or *glacial, sulphuric acid* (sp. gr. 1.78); and H_6SO_6, *trihydrated*, or *ortho-, sulphuric acid* (sp. gr. 1.63). The glacial sulphuric acid is so called because it solidifies in cold weather. — **sulphuric anhydride**, sulphur trioxide. — **s. chloranhydride**, sulphuryl chloride. — **s. ether** = ETHER, 2 **a**.

SOLAR, SOUTH.] **1.** The luminous heavenly body the light of which constitutes day, and absence of the light of which constitutes night; the member of the solar system round which the earth and other planets revolve, by which they are held in their orbits, and from which they receive light and heat. Symbol, ☉ or ☼. The horizontal parallax of the sun at mean distance from the earth has in recent years been taken to be 8.80″, but 8.78″ is more probable. On the latter basis the mean distance of the sun from the earth is about 93,100,000 miles, its linear diameter 866,300 miles, and its mass 334,500 times that of the earth. Its mean density is about one fourth that of the earth, or 1.41 compared with water. The sun is regarded as an immense globe of matter not greatly different in kind from that of the earth, but so extremely hot as to remain completely, or almost completely, gaseous, in spite of the very considerable pressure exerted by the mutual attraction of its particles. Its period of rotation is about 25 days at the equator, but decreases toward the poles and probably increases from the surface toward the center. Of the sun's interior we know nothing by observation, though the immense amount of energy radiated (see SOLAR CONSTANT) seems to imply necessarily that it is full of convection currents. Its luminous surface layer is called the **photosphere,** above which is the red **chromosphere,** the boundary between the two being the thin **reversing layer;** while outermost of all is the tenuous **corona.** (See also SUN SPOT and FACULA.) The spectrum of the sun is characterized by many dark lines (see FRAUNHOFER LINES) produced by absorption by the vapor of various metals, particularly calcium, and the sun is hence regarded as the type of a certain class of stars. The commonly accepted theory as to the sun's heat is that it is due to a contraction calculated to be somewhat more than 225 feet per annum, but the phenomena of radioactivity may affect this theory.
2. Any heavenly body of the same general nature as our sun, esp. one forming, like it, the center of a system.
3. The direct light or warmth of the sun; sunshine.

surface tension. *Physics.* That property, due to molecular forces, which exists in the *surface film* of all liquids and tends to bring the contained volume into a form having the least superficial area. The thickness of this film, amounting to less than a thousandth of a millimeter, is considered to equal the radius of the sphere of molecular action, that is, the greatest distance at which there is cohesion between two particles. Particles lying below this film, being equally acted on from all sides, are in equilibrium as to forces of cohesion, but those in the film are on the whole attracted inward, and tension results. Surface tension is numerically equal to the force acting at right angles to a line of unit length (say one centimeter) lying on the surface, and in this sense is called also the **constant of capillarity** and is represented by the symbol T.

eral letters taken together so as to form one sound, a syllable, fr. συλλαμβάνειν to take together ; συν with + λαμβάνειν to take ; cf. Skr. *labh, rabh*. Cf. DILEMMA, LEMMA.] **1.** An elementary sound, or a combination of such sounds, uttered together with a single effort or impulse of the voice, and constituting a word or a part of a word. In other terms, a syllable is a vowel or a diphthong, either by itself or flanked by one or more consonants, the whole produced by a single impulse or utterance. Certain consonants, as *l, m, n, r*, may fill the place of a vowel in forming a syllable. Adjoining syllables in a word or phrase need not be marked off by a pause, but only by such an abatement and renewal, or reënforcement, of the stress as to give the feeling of separate impulses. See *Guide to Pron.*, §110.

2. In writing and printing, a part of a word separated from the rest and capable of being pronounced by a single impulse of the voice. It may or may not correspond to a syllable in the spoken language.

See SYN- ; LOGISTIC, LOGIC.] **1.** A logical scheme or analysis of a formal argument, consisting of three propositions (called respectively the *major premise*, the *minor premise*, and the *conclusion*). The conclusion necessarily follows from the premises ; so that, if these are true, the conclusion must be true, and the argument amounts to demonstration ; as in the following example :—

Every virtue is laudable ;
Kindness is a virtue ;
Therefore kindness is laudable.

The major premise is usually treated as a general rule of which the minor premise is a case and the conclusion an application. The two premises are related by a middle, or common, term which disappears in the conclusion ; and for this reason the syllogism is often treated as a process of elimination. The formal validity of the syllogism is entirely distinct from its truth, which depends upon the truth of its premises ; and since, as Mill has shown, the major premise represents a generalization of experience, the function of the syllogism is sometimes conceived not so much a means of giving knowledge a new form as of testing this generalization by the application to it of the particular case. See FIGURE, 13 ; MODE, 3 b ; PREMISE, 1 ; TERM.

2. Deductive reasoning ; explication of the relations of ideas, esp. in accordance with syllogistic principles.

They concerned themselves with general truths instead of realities, exalted the metaphysical and the mysterious, esp. the mystical power and charm of music, and aimed to unify and blend the arts and the functions of the senses. Their lyric poetry resembles music in its object, endeavoring to render by rhythms and sounds sentiments and emotions which escape analysis. syncopated counterpoint, *Music*, counterpoint in which one note is added to each note of the cantus firmus after a fixed rhythmic interval.

syn′co-pa′tion (sĭŋ′kō-pā′sh*ŭ*n), *n.* A syncopating: **a** *Gram.* Syncope. **b** *Music.* The commencing of a tone on an unaccented part of a measure, and continuing it through the time of the following accent, which is thereby at least apparently shifted back; the welding into one tone of the second half of a beat with the first half of the following. Syncopation may be effected also by a sforzando on a note not regularly accented, or by introducing a rest at the regular accent.

Syncopation.

The essential nature of the *syncopation* is best seen in its rhythmic use. This consists in the imposing of a new regular accent rhythm upon the old, continued, on the one hand, long enough to command recognition as a rhythm; and, on the other, not so long as to supplant the old rhythm, and thus cause an actual change of time. *G. C. Gow.*

syn′co-pe (sĭŋ′kō-pē), *n.* [L. *syncope*, *syncopa*, Gr. συγκοπή a cutting up, a syncope; akin to συγκόπτειν to beat together, to cut up, cut short, weary; σύν with + κόπτειν to strike, cut.] **1.** *Gram.* Elision or retrenchment of one or more letters or sounds or a syllable from the middle of a word; as, *ne′er* for *never*, *ev′ry* for *every*. Cf. SYNCOPATE, *v. t.*, 1.

The term *syncope* is commonly applied to the loss of a vowel only. But there are cases where a whole syllable is lost, under essentially the same conditions under which vowels are syncopated (namely, in unstressed position), and which, therefore, might aptly be called syllabic *syncope*. *Oertel.*

Another kind of *syncope* appears in the shortening of vowels, as in *shepherd* for *sheepherd*. *Skeat.*

In religion, the term is used both for serious effort at reconciliation, and, in a disparaging sense, for egregious compromise in religion. Specif. [*often cap.*], *syncretism* is applied to the principles of a Lutheran party of the 17th century which, led by George Calixtus, sought to unite or reconcile the Protestant sects with each other and with the Roman Catholics, causing a long and violent controversy in the Lutheran Church. In the Eastern Church *synod* is applied to various governing bodies as well as to formal ecclesiastical meetings. See under GENERAL, *a.*, HOLY, *a.*

3. An assembly or council; a meeting or convention.

4. *Astron.* Conjunction. *Rare.* *Milton.*

Synod of Dort, *Eccl. Hist.*, a synod of the Reformed Church of the Netherlands held at Dort (Dordrecht) in 1618–19. It was convoked by the States-General to settle the controversy between Calvinists and Arminians, and delegates from the reformed churches of other countries were invited. The doctrines of the Arminians or Remonstrants, who were excluded, were condemned, the Belgic Confession and the Heidelberg Catechism were sanctioned, and the Canons of Dort, teaching Calvinism in an unadulterated, but yet not extreme, form, were promulgated.

syn'o-nym (sĭn'ō-nĭm), *n.* [F. *synonyme*, or L. *synonyma*, pl. of *synonymum*, Gr. *συνώνυμον*. See SYNONYMOUS.] **1.** One of two or more words of the same language having the same or nearly the same essential meaning. Words that are *synonyms* of one another may be: (1) Words of like implication throughout, their difference appearing only in certain applications; thus we conventionally say "*unlikely* to happen," but not "*improbable* to happen." Such *synonyms* in English commonly arise from the duplication of a given sense by words from Anglo-Saxon and from Romance. (2) Words of like implication only in one of two or more senses. Thus *dull* is a *synonym* of *stupid* as said of a pupil, but not as said of a knife. A thorough analysis of *synonyms* will in most cases show that the words actually have marked differences of meaning, and are interchangeable only because their difference does not affect the speaker's intention in a given context. Thus to *secure* and *attain* (an object) are *synonyms* because their sense "comes to the same thing," although they come to it, etymologically, by way of different metaphors.

His name has thus become, throughout all civilized countries, a *synonym* for probity and philanthropy. *Macaulay.*

2. An incorrect or incorrectly applied scientific name, as a new name applied to a species or genus already properly named, or a specific name preoccupied by that of another species of the same genus; — so used in the system of nomenclature (which see) in which the correct scientific names of certain natural groups (usually genera, species, and subspecies) are regarded as determined by priority.

3. One of two or more words corresponding in meaning but of different languages; a heteronym. *Rare.*

Syn. — SYNONYM, ANTONYM, HOMONYM. SYNONYMS are words which express what is essentially the same idea, but which (commonly) differ from one another in some shade of meaning, in emphasis, or (esp.) in their connotations; ANTONYMS are terms of opposite meaning; HOMONYMS are words which, though entirely distinct in origin and meaning, are pronounced alike and sometimes spelt in the same way. Thus, *sharp* and *keen* are *synonyms*; *sharp* and *dull* are *antonyms*; *beaver* (the animal) and *beaver* (the lower part of a helmet) are *homonyms*.
